# **Lab: Classes and Objects**

Problems for exercise and homework for the Python OOP Course @SoftUni. Submit your solutions in the SoftUni judge system at https://judge.softuni.bg/Contests/1936.

#### 1. Vehicle

Create a class called Vehicle. Upon initialization, it should receive max speed (integer, optional; 150 by default) and mileage (number). Create an instance variable called gadgets - an empty list by default.

### **Examples**

Test Code	Output
<pre>car = Vehicle(20) print(car.max_speed) print(car.mileage) print(car.gadgets) car.gadgets.append('Hudly Wireless') print(car.gadgets)</pre>	150 20 [] ['Hudly Wireless']

#### 2. Point

Create a class called **Point**. Upon initialization, it should receive **x** and **y** (**numbers**). Create **3 instance methods**:

- set\_x(new\_x) changes the x value of the point
- set\_y(new\_y) changes the y value of the point
- str () returns the coordinates of the point in the format "The point has coordinates  $({x},{y})$ "

### **Examples**

Test Code	Output
	The point has coordinates (2,4) The point has coordinates (3,5)

#### 3. Circle

Create a class called Circle. Upon initialization, it should receive a radius (number). Create a class attribute called **pi** which should be equal to **3.14**. Create **3 instance methods**:

- set\_radius(new\_radius) changes the radius
- get area() returns the area of the circle
- get\_circumference() returns the circumference of the circle

### **Examples**

Test Code	Output
<pre>circle = Circle(10) circle.set_radius(12) print(circle.get_area())</pre>	452.16 75.36

### 4. Glass

Create a class called Glass. Upon initialization, it will not receive any parameters. You must create an instance attribute called content which should be equal to 0. You should also create a class attribute called capacity which should be 250 ml. Create 3 instance methods:

- fill(ml) fills the glass with the given milliliters if there is enough space in it and returns "Glass filled with {ml} ml", otherwise returns "Cannot add {ml} ml"
- empty() empties the glass and returns "Glass is now empty"
- info() returns info about the glass in the format "{space left} ml left"

### **Examples**

Test Code	Output
<pre>glass = Glass() print(glass.fill(100)) print(glass.fill(200)) print(glass.empty()) print(glass.fill(200)) print(glass.info())</pre>	Glass filled with 100 ml Cannot add 200 ml Glass is now empty Glass filled with 200 ml 50 ml left

## 5. Smartphone

Create a class called Smartphone. Upon initialization, it should receive a memory (number). It should also have 2 other instance attributes: apps (empty list by default) and is\_on (False by default). Create 3 methods:

- power() sets is on on True if the phone is off, otherwise sets it to False
- install(app, app\_memory)
  - o If there is enough memory on the phone and it is on, installs the app (add it to apps and decrease the memory of the phone) and returns "Installing {app}"
  - If there is enough memory, but the phone is off, returns "Turn on your phone to install {app}"
  - Otherwise, returns "Not enough memory to install {app}"
- status() returns "Total apps: {total apps count}. Memory left: {memory left}"

### **Examples**

Test Code	Output
<pre>smartphone = Smartphone(100) print(smartphone.install("Facebook", 60)) smartphone.power() print(smartphone.install("Facebook", 60)) print(smartphone.install("Messenger", 20)) print(smartphone.install("Instagram", 40)) print(smartphone.status())</pre>	Turn on your phone to install Facebook Installing Facebook Installing Messenger Not enough memory to install Instagram Total apps: 2. Memory left: 20
