### **More Exercise: Dictionaries**

Additional exercises for the Python Fundamentals Course @SoftUni. Submit your solutions in the SoftUni judge system at <a href="https://judge.softuni.org/Contests/1738">https://judge.softuni.org/Contests/1738</a>.

Note: All the exercises are excluded from your homework!

### 1. Ranking

Here comes the final and the most interesting part – the Final ranking of the candidate-interns. The final ranking is determined by the points of the interview tasks and by the points from the exams in SoftUni. Here is your final task. You will receive some lines of input in the format "{contest}: {password for contest}" until you receive "end of contests". Save that data because you will need it later. After that you will receive other type of inputs in format "{contest}=>{password}=>{username}=>{points}" until you receive "end of submissions". Here is what you need to do.

- Check if the contest is valid (It is considered valid if you received it in the first type of input)
- Check if the password is correct for the given contest
- If the contest and the password is valid, save the user with the contest they take part in (a user can take part in many contests) and the points the user has in the given contest. If you receive the same contest and the same user update the points only if the new ones are more than the older ones.

In the end, you should print the info for the user with the most points (total points for all contents they participated in) in the format "Best candidate is {user} with total {total\_points} points.". After that print all students ordered by their names. For each user print each contest with the points in descending order. See the examples.

#### Input

- Strings in format "{contest}:{password for contest}" until the "end of contests" command. There will be no case with two equal contests
- Strings in format "{contest}=>{password}=>{username}=>{points}" until the "end of submissions" command.
- There will be no case with 2 or more users with same total points!

### Output

- On the first line, print the best user in format "Best candidate is {user} with total {total points} points.".
- Then print all students ordered as mentioned above in format:

```
"{user name1}
# {contest1} -> {points}
# {contest2} -> {points}
# {contestN} -> {points}"
```

#### **Constraints**

The strings may contain any ASCII character except from (:, =, >).

- The numbers will be in range [0 10000].
- Second input is always valid.

#### **Examples**

Input	Output
Part One Interview:success	Best candidate is Tanya with total
JS Fundamentals:fundExam	1350 points.
C# Fundamentals:fundPass	Ranking:
Algorithms:fun	Nikola
end of contests	# C# Fundamentals -> 200
C# Fundamentals=>fundPass=>Tanya=>350	# Part One Interview -> 120
Algorithms=>fun=>Tanya=>380	Tanya
Part One Interview=>success=>Nikola=>120	# JS Fundamentals -> 400
<pre>Java Basics Exam=&gt;wrong_pass=&gt;Teo=&gt;400</pre>	# Algorithms -> 380
Part One Interview=>success=>Tanya=>220	# C# Fundamentals -> 350
OOP Advanced=>password123=>Kay=>231	# Part One Interview -> 220
C# Fundamentals=>fundPass=>Tanya=>250	
C# Fundamentals=>fundPass=>Nikola=>200	
<pre>JS Fundamentals=&gt;fundExam=&gt;Tanya=&gt;400</pre>	
end of submissions	
Java Advanced:funpass	Best candidate is Simona with total
Part Two Interview:success	880 points.
Math Concept:asdasd	Ranking:
Java Web Basics:forrF	Drago
end of contests	# Math Concept -> 250
Math Concept=>ispass=>Monika=>290	# Part Two Interview -> 120
Java Advanced=>funpass=>Simona=>400	Petyr
Part Two Interview=>success=>Drago=>120	# Java Advanced -> 90
Java Advanced=>funpass=>Petyr=>90	<pre># Part Two Interview -&gt; 0</pre>
Java Web Basics=>forrF=>Simona=>280	Simona
Part Two Interview=>success=>Petyr=>0	# Java Advanced -> 400
Math Concept=>asdasd=>Drago=>250	# Java Web Basics -> 280
Part Two Interview=>success=>Simona=>200	# Part Two Interview -> 200
end of submissions	

# 2. Judge

You know the judge system, right?! Your job is to create a program similar to the Judge system.

You will receive **several input lines** in one of the following formats:

```
"{username} -> {contest} -> {points}"
```

The "contest" and "username" are strings, the given "points" will be an integer number. You need to keep track of every contest and points of each user:

- If the user has already participated in the contest, update their points only if the new ones are more than the older ones.
- Otherwise, just **save the data** contest, username, and points.

Also, you need to keep individual statistics for each user - the total points of all contests (including even points from the same contents).

You should end your program when you receive the command "no more time". At that point you should print each contest in order of input, for each contest print the participants ordered by points in descending order, then

ordered by name in ascending order. After that, you should print individual statistics for every participant ordered by total points in descending order, and then by alphabetical order.

#### **Input / Constraints**

- The input comes in the form of commands in one of the formats specified above.
- Username and contest name always will be one word.
- Points will be an integer will be an integer in range [0, 1000].
- There will be **no invalid** input lines.
- If all sorting criteria fail, the order should be by order of input.
- The input ends when you receive the command "no more time".

#### **Output**

• The output format for the contests is:

```
"{constest_name}: {number_participants} participants
1. {username1} <::> {points}
2. {username2} <::> {points}
{N}. {usernameN} <::> {points}"
```

- After you print all contests, print the **individual statistics for every participant.**
- The output format is:

```
"Individual standings:
```

```
1. {username1} -> {total_points}
```

2. {username} -> {total\_points}

{N}. {username} -> {total\_points}"

### **Examples**

Input	Output
Peter -> Algo -> 400	Algo: 3 participants
George -> Algo -> 300	1. Peter <::> 400
Simo -> Algo -> 200	2. George <::> 300
Peter -> DS -> 150	3. Simo <::> 200
Mariya -> DS -> 600	DS: 2 participants
no more time	1. Mariya <::> 600
	2. Peter <::> 150
	Individual standings:
	1. Mariya -> 600
	2. Peter -> 550
	3. George -> 300
	4. Simo -> 200

Peter -> 00P -> 350 OOP: 3 participants George -> OOP -> 250 1. Peter <::> 350 Simo -> Advanced -> 600 2. George <::> 300 George -> 00P -> 300 3. Prakash <::> 300 Prakash -> 00P -> 300 Advanced: 2 participants Prakash -> Advanced -> 250 1. Simo <::> 600 Ani -> JSCore -> 400 2. Prakash <::> 250 no more time JSCore: 1 participants 1. Ani <::> 400 Individual standings: 1. Simo -> 600 2. Prakash -> 550

### 3. MOBA Challenger

You are a pro MOBA player, you are struggling to become a master of the Challenger tier. So, you carefully watch the statistics in the tier.

3. Ani -> 400 4. Peter -> 350 5. George -> 300

You will receive several input lines in one of the following formats:

```
"{player} -> {position} -> {skill}"
"{player} vs {player}"
```

The "player" and "position" are strings, and the given "skill" will be an integer number. You need to keep track of every player.

When you receive a player with his position and skill, add him to the players' pool, if he isn't present, else add his position and skill or update his skill, only if the current position skill is lower than the new value.

If you receive "{player} vs {player}" and both players exist in the tier, they duel with the following rules:

- If they got at least one position in common, the player with better total skill points wins and the other is **demoted** from the tier -> remove him.
- If they have same total skill points at the same positions, the duel is tie and they both continue in the Season.
- If they don't have positions in common, the duel isn't happening and both continue in the Season.

You should end your program when you receive the command "Season end". At that point you should print the players, ordered by total skill in descending order, then ordered by player name in ascending order. For each player print their position and skill, ordered descending by skill, then ordered by position name in ascending order.

## **Input / Constraints**

- The input comes in the form of commands in one of the formats specified above.
- Player and position will always be one word string, containing no whitespaces.
- Skill will be an **integer** in the **range** [0, 1000].
- There will be **no invalid** input lines.
- The program ends when you receive the command "Season end".

#### Output

The output format for each player is:

```
"{player}: {total_skills} skill"
- {position1} <::> {skill}
- {position2} <::> {skill}
- {positionN} <::> {skill}"
```

#### **Examples**

Input	Output	Comments
Peter -> Adc -> 400 George -> Jungle -> 300 Simon -> Mid -> 200 Simon -> Support -> 250 Season end	Simon: 450 skill - Support <::> 250 - Mid <::> 200 Peter: 400 skill - Adc <::> 400 George: 300 skill - Jungle <::> 300	We order the players by total skill points descending, then by name. We print every position along its skill ordered descending by skill, then by position name.
Peter -> Adc -> 400  Bush -> Tank -> 150  Frank -> Mid -> 200  Frank -> Support -> 250  Frank -> Tank -> 250  Peter vs Frank  Frank vs Bush  Frank vs Hide  Season end	Frank: 700 skill - Support <::> 250 - Tank <::> 250 - Mid <::> 200 Peter: 400 skill - Adc <::> 400	Frank and Peter don't have common position, so the duel isn't valid.  Frank wins vs Bush /common position: "Tank". Bush is demoted.  Hide doesn't exist so the duel isn't valid.  We print every player left in the tier.

### 4. Snow White

Snow White loves her dwarfs, but there are so many, and she doesn't know how to order them. Does she order them by name? Or by color of their hat? Or by physics? She can't decide, so it's up to you to write a program that does it for her.

You will be receiving **several input lines** which contain **data** about each **dwarf** in the following format:

```
{dwarf_name} <:> {dwarf_hat_color} <:> {dwarf_physics}
```

The "dwarf\_name" and the "dwarf\_hat\_color" are strings. The "dwarf\_physics" is an integer.

You must **store** the data about the **dwarfs** in your program. There are several rules though:

- If 2 dwarfs have the same name but different color, they should be considered different dwarfs, and you should store them **both**.
- If 2 dwarfs have the same name and the same color, store the one with the higher physics.

When you receive the command "Once upon a time", the input ends. You must order the dwarfs by physics in descending order and then by total count of dwarfs with the same hat color in descending order. Then you must print them all.

#### Input

- The input will consist of **several input lines**, containing **dwarf data** in the format, specified above.
- The input **ends** when you receive the command **"Once upon a time"**.

#### **Output**

- As output, you must print the **dwarfs**, **ordered** in the way, specified above.
- The output format is: "({hat\_color}) {name} <-> {physics}"

#### **Constraints**

- The "dwarf\_name" will be a string which may contain any ASCII character except ' '(space), '<', ':', '>'.
- The "dwarf\_hat\_color" will be a string which may contain any ASCII character except ' '(space), '<', **':**', '>'.
- The "dwarf\_physics" will be an integer in range [0, 2<sup>31</sup> 1].
- There will be **no invalid** input lines.
- If all sorting criteria fail, the order should be by order of input.
- Allowed working time / memory: 100ms / 16MB.

#### **Examples**

Input	Output
Peter <:> Red <:> 2000	(Yellow) Simon <-> 4500
Teodor <:> Blue <:> 1000	(Red) Peter <-> 2000
George <:> Green <:> 1000	(Blue) Teodor <-> 1000
Simon <:> Yellow <:> 4500	(Green) George <-> 1000
Dopey <:> Simon <:> 1000	(Simon) Dopey <-> 1000
Once upon a time	
Grumpy <:> Red <:> 5000	(Blue) Grumpy <-> 10000
Grumpy <:> Blue <:> 10000	(Blue) Happy <-> 10000
Grumpy <:> Red <:> 10000	(Red) Grumpy <-> 10000
Happy <:> Blue <:> 10000	
Once upon a time	

# 5. Dragon Army

Heroes III is the best game ever. Everyone loves it and everyone plays it all the time. Simon is no exclusion to this rule. His favorite units in the game are all types of dragons – black, red, gold, azure etc. He likes them so much that he gives them **names** and keeps logs of their **stats**: **damage, health,** and **armor**. The process of aggregating all the data is quite tedious, so he would like to have a program doing it. Since he is no programmer, it's your task to help him.

You need to categorize dragons by their type. For each dragon, identified by name, keep information about his stats (damage, health, and armor). Type is preserved as in the order of input, but dragons are sorted alphabetically by their name. For each type, you should also print the average damage, health, and armor of the dragons. For each dragon, print his own stats.

There may be missing stats in the input, though. If a stat is missing you should assign it default values. Default values are as follows: health 250, damage 45, and armor 10. Missing stat will be marked by "null".

The input is in the following format "{type} {name} {damage} {health} {armor}".

The "type" and the "name" are strings. The "damage", the "health", and the "armor" are integers. Any of the integers may be assigned "null" value. See the examples below for better understanding of your task.

If the same dragon is added a second time, the new stats should overwrite the previous ones. Two dragons are considered **equal** if they match by **both name** and **type**.

#### Input

- On the **first** line, you are given **number N** -> the number of dragons to follow.
- On the **next N** lines, you are given input in the above-described format. There will be a **single space** separating each element.

#### Output

- Print the aggregated data on the console.
- For each type, print stats of its dragons in format average "{type}::({damage}/{health}/{armor})".
- **Damage**, health, and armor should be rounded to two digits after the decimal separator.
- For each dragon, print its stats in format "-{Name} -> damage: {damage}, health: {health}, armor: {armor}".

#### **Constraints**

- N is in range [1...100].
- The dragon type and name are one word only, starting with capital letter.
- Damage health and armor are integers in range [0 ... 100000] or null.

### **Examples**

Input	Output
5 Red Bazgargal 100 2500 25 Black Dargonax 200 3500 18 Red Obsidion 220 2200 35 Blue Kerizsa 60 2100 20 Blue Algordox 65 1800 50	Red::(160.00/2350.00/30.00) -Bazgargal -> damage: 100, health: 2500, armor: 25 -Obsidion -> damage: 220, health: 2200, armor: 35 Black::(200.00/3500.00/18.00) -Dargonax -> damage: 200, health: 3500, armor: 18 Blue::(62.50/1950.00/35.00) -Algordox -> damage: 65, health: 1800, armor: 50 -Kerizsa -> damage: 60, health: 2100, armor: 20
4 Gold Zzazx null 1000 10 Gold Traxx 500 null 0 Gold Xaarxx 250 1000 null Gold Ardrax 100 1055 50	Gold::(223.75/826.25/17.50) -Ardrax -> damage: 100, health: 1055, armor: 50 -Traxx -> damage: 500, health: 250, armor: 0 -Xaarxx -> damage: 250, health: 1000, armor: 10 -Zzazx -> damage: 45, health: 1000, armor: 10
