More Exercises: Data Types and Variables

Additional exercises for the Python Fundamentals Course @SoftUni.

Submit your solutions in the SoftUni judge system at https://judge.softuni.bg/Contests/1723.

Note: All the exercises are excluded from your homework!

1. Exchange Integers

Read two integer numbers and after that **exchange their values**. Print the variable values before and after the exchange, as shown below:

Examples

Input	Output
5 10	Before: a = 5 b = 10 After: a = 10 b = 5

Hints

You may use a **temporary variable** to remember the old value of **a**, then assign the value of **b** to **a**, then assign the value of the temporary variable to **b**.

2. Prime Number Checker

Write a program to check if a number is **prime**. A prime number is a natural number greater than 1 that is not a product of two smaller natural numbers. For example, the only ways of writing 5 as a product, 1 × 5 or 5 × 1, involve 5 itself.

The **input** comes as an integer number.

The **output** should be **True** if the number is prime and **False** otherwise.

Examples

Input	Output
7	True

Input	Output
8	False

Input	Output
81	False

3. Decrypting Messages

On the **first line**, you will receive a **key (integer)**. On the **second line**, you will receive **n** – the number of **lines**, which will **follow**. On the next **n lines** – you will receive a **lower** and an **uppercase** letter per line.

You should **add the key** to **each of the characters** and append them to a **message**. At the end **print the decrypted message**.

Examples

Input	Output		Input	Output

s	

4. Balanced Brackets

On the **first line**, you will receive **n** – the number of lines, which will follow. On the next **n** lines, you will receive **one** of the following:

- Opening bracket – "**(**",
- Closing bracket – "**)**" or
- **Random string**

Your task is to find out if the **brackets** are **balanced**. That means after every **closing** bracket should follow an **opening** one. Nested parentheses are **not valid**, and if **two consecutive opening brackets** exist, the expression should be marked as **unbalanced**. You should print "**BALANCED**", if the parentheses are balanced and "**UNBALANCED**" otherwise.

Examples

Input	Output
8 (5 + 10) * 2 + (5) -12	BALANCED

Input	Output
6 12 *) 10 + 2 - (5 + 10)	UNBALANCED
